

NRG® SOFTWARE

UNLEASH UNPRECEDENTED CONNECTIVITY

Parraid's Network Radio Gateway (NRG®) is a Program of Record (PoR) fielded Radio over IP (RoIP) interoperability ecosystem that bridges tactical radios, coalition systems, Land Mobile Radios, MANET, SATCOM, and IP networks into a unified voice and data architecture, without replacing existing radio infrastructure. As communications networks become more complex, operators need to be interoperable with Joint, Coalition, and mission partners to conduct effective Situational Awareness, Command and Control (C2), and targeting activities. The requirement for a battle proven RoIP solution is a part of that mission, connecting users with different hardware to provide voice and data connectivity and Tactical Mission Network interoperability.

NRG PROVIDES RoIP CAPABILITIES FROM ENTERPRISE TO EDGE

Engineered to deliver reliable, scalable, flexible, and secure radio communications, NRG software seamlessly bridges the gap from the tactical edge to enterprise networks.

NETWORK RADIO GATEWAY (NRG)

The industry's leading Radio over IP gateway — bridging tactical and enterprise communications since 2003.

Decentralized Mesh

No single point of failure — fault-tolerant, modular, scalable

Full RoIP Suite

Voice routing, protocol conversion, radio bridging (crossbanding)

Remote Radio Control

Program and manage radios from a single intuitive interface

JITC Certified

Listed on the DISA Approved Product List

Flexible Form Factors

Rackmount (RM), Deployable (DS-04v3), Integrated (LS-04™), and Wearable (OWL™)

Full Recording

Voice and conference audio for forensics and operational analysis

Fully Operational in Denied, Degraded, Intermittent, and Limited-Bandwidth (DDIL) Environments — No persistent connection to cloud infrastructure, central servers, or external management planes are required for tactical voice and data operations. The system maintains full functionality during periods of complete network isolation from enterprise or Beyond Line of Sight (BLOS) infrastructure.

Operates in a Decentralized Peer-to-Peer Mesh Architecture that Requires No Central Broker, Controller, or Persistent Server Connection — All gateway nodes can establish and maintain connectivity without a single point of failure in the communications architecture as stand-alone nodes or enterprise connected.

NRG's Plug-In Framework — Runs on CMOSS, Android, and Linux hardware, minimizing proprietary lock-in and supporting integration into existing DevSecOps pipelines.

Simultaneous Operation Across Any Transport Infrastructure Available — Includes, but not limited to: SATCOM, 5G/LTE (including private network deployments), fiber, WiFi, tactical radios, Commercial MANET radios, and tactical LAN. The system performs transport arbitration and quality-of-service management across concurrent transport paths without operator intervention.

Your All-In-One RoIP Solution — Why juggle multiple systems when you can have a complete solution? NRG gateways and clients offer comprehensive support for voice packet routing, protocol conversion, and radio voice bridging (crossbanding). Maximize interoperability across diverse communication platforms and ensure your team stays connected, no matter the devices they're using.

Unmatched Control and Data Management — Take command with NRG's unparalleled software suite. Our cutting-edge technology provides exceptional capabilities in remote radio programming, control, and radio data management. Simplify your operations by managing your entire radio network from a single, intuitive interface.

Technology & Capability Insertion — Parraid continuously strives to add capabilities. Near term upgrades include real-time language translation and transcription services and availability of NRG containerization.

The NRG bridges the interoperability gap between radio systems and IP-based networks
