

EDGE²™ TELEMETRY NETWORK APPLIANCE WITH INTEGRATED RELIABLE TRANSPORT GATEWAY (RTG™)

The Parraid Edge² with Integrated RTG capability combines advanced RF to Ethernet telemetry processing with a built in reliable IP transport layer. This integrated solution enables users to generate and deliver high rate TMoIP telemetry data while combating packet loss over unreliable WAN links—including public IP, SATCOM, and extended range networks.

INTEGRATED ARCHITECTURE

KEY FEATURES

Edge² Telemetry RF Processing

- Two channel, high performance telemetry receiver and combiner
- End to end RF to Ethernet telemetry conversion in a single compact appliance
- Native support for IRIG 106 Chapter 10/11 and IRIG 218 20 (TMoIP) output formats
- High rate telemetry processing up to 50 Mbps per channel
- Integrated timing support for IRIG A, B, and G and IEEE 1588 PTP
- Input support for telemetry Chapter 4, 7, and 8 formats
- Optional quad band RF receiver modules covering L,S,C, and P bands
- Optional high performance Bit Syncs delivering 1 dB performance
- Portable or 1U rack mountable form factor, 1/3 width supporting up to six channels per 1U rack space

Reliable TMoIP Transport Capability (Integrated RTG)

- Embedded reliable transport layer operating transparently over UDP based telemetry streams
- Selective packet retransmission to recover telemetry lost on unreliable IP networks
- Adaptive buffering, pacing, and jitter mitigation designed for extended range transmission
- Configurable latency profiles optimized for real-time flight test telemetry delivery
- Integrated AES encryption option
- Comprehensive transport performance monitoring, including latency, loss, jitter, throughput, and retransmission metrics

WHY INTEGRATED RTG MATTERS

- Simplifies telemetry system architectures and lowers overall system Size, Weight, and Power (SWaP) requirements
- Eliminates the need for external transport gateways
- Improves telemetry integrity and delivery confidence across real world networks
- Enables high rate telemetry delivery where traditional best effort UDP transport falls short
- Shifts remotely deployed telemetry delivery from a best effort assumption to a predictable, mission ready pipeline
